Zeporah Workflow Coverage & Gap-Resolution Audit

Product-Design Review Across All Six Family Journeys

> **Scope:** Care & Preparation; When Death Occurs; Honor & Remember; Estate & Life Administration; Family Coordination; Continuing Care.
> **Review lens:** Emotional safety, immediate safety, legal/medical/financial boundaries, privacy, consent, permissions, family conflict, accessibility, cultural respect, state localization, operational readiness, and lifecycle transitions.

Executive conclusion

The six workflows now form a credible end-to-end **family coordination system**. They cover the major family journey from serious illness through the months after loss, and they include strong protection against the most common product harms: over-sharing, authority assumptions, aggressive tasking, unwanted outreach, family conflict, and grief-insensitive timing.

However, a safe, launch-ready product requires several additional **cross-workflow systems.** These are not separate family journeys; they are foundational capabilities that must operate underneath every workflow.

The most important additions are:

1. **A universal emergency, crisis, and safety layer.**
2. **A consent, permissions, and audit ledger.**
3. **A localization and policy layer for state-, county-, and situation-specific information.**
4. **An accessibility, language, and low-tech-access design standard.**
5. **A resource-quality and provider-neutrality operating model.**
6. **A handoff, backup, death/incapacity, and account-recovery policy.**
7. **A notification-governance system that works across every module.**
8. **A clear support and escalation model for the Zeporah team.**

These are now specified below as required additions to the workflows.

Coverage map

Design area	Care & Preparation	When Death Occurs	Honor & Remember	Estate & Life Administration	Family Coordination	Continuing Care	Required cross-product solution
Emotional pacing	Strong	Strong	Strong	Strong	Strong	Strong	Universal “one next step / pause” pattern
Emergency safety	Partial	Strong	Partial	Partial	Partial	Partial	Universal crisis/safety layer

Design area	Care & Preparation	When Death Occurs	Honor & Remember	Estate & Life Administration	Family Coordination	Continuing Care	Required cross-product solution
Medical boundary	Strong	Strong	N/A	N/A	Strong	N/A	Scope statement + care-team handoff
Legal/financial boundary	Partial	Strong	Strong	Strong	Strong	Strong	Authority gate + guidance routing
Privacy & access	Strong	Strong	Strong	Strong	Strong	Strong	Consent/permissions ledger
Family conflict	Strong	Strong	Strong	Strong	Strong	Strong	Decision-card and pause standard
Cultural/religious inclusion	Partial	Partial	Strong	Partial	Partial	Partial	Preference & localization layer
Disability/language access	Partial	Partial	Partial	Partial	Partial	Partial	Accessibility & language standard
State/local variation	Partial	Partial	Partial	Partial	N/A	Partial	Localization engine + editorial review
Provider/resource quality	Partial	Partial	Strong	Partial	Partial	Strong	Resource governance model
Financial hardship	Partial	Partial	Partial	Partial	Partial	Partial	Support and hardship pathways
Data security/retention	Partial	Partial	Partial	Partial	Strong	Partial	Data lifecycle policy
Account recovery/handoff	Partial	Partial	Partial	Strong	Strong	Partial	Controlled recovery policy
Notifications	Partial	Strong	Partial	Partial	Strong	Strong	Notification governance layer

Cross-workflow system 01

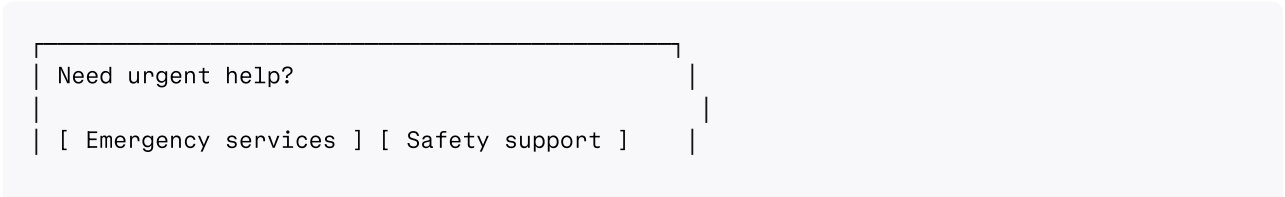

Universal emergency, crisis, and safety layer

Gap

Emergency or safety needs can arise in any workflow—not only when a death occurs. A caregiver may be in danger, a family member may be threatening another person, a person may be experiencing acute distress, or a care recipient may need immediate medical attention.

Solution

Add a persistent but unobtrusive **Get urgent help** affordance on every authenticated screen.

```
| [ Exit Zeporah quickly ]                    |
└─────────────────────────────────────────────┘
```

Product behavior

- **Emergency services:** opens the device calling flow; localized emergency number where supported.
- **Safety support:** presents discreet, localized support information only after the user selects it.
- **Quick exit:** immediately routes to a neutral screen and clears the current page's sensitive display from the app view.
- The app must state plainly that it cannot monitor emergencies or guarantee immediate assistance.
- No alert goes to family members, providers, or Zeporah support without explicit user action, except as required by applicable law and clearly described policy.

Workflow updates required

- **Care & Preparation:** Add urgent-help card next to care-team contact area.
- **When Death Occurs:** Preserve emergency routing as highest priority.
- **Honor & Remember:** Add safety and privacy route near guest/announcement controls.
- **Estate Administration:** Add safety route for home/property or coercion concerns.
- **Family Coordination:** Add Access Lockdown plus safety support.
- **Continuing Care:** Add quiet, nonintrusive urgent-help access.

Cross-workflow system 02

Consent, permissions, and audit ledger

Gap

The flows define excellent permissions, but the product needs one authoritative system that can answer: who saw what, who shared what, what consent was given, when access changed, and what the user can revoke.

Solution

Create a **Privacy Center** visible to the Workspace Organizer and a limited "My Access" view for every collaborator.

```
┌─────────────────────────────────────────────┐
| Privacy Center                              |
|                                             |
| PEOPLE                                      |
|  Jordan — service helper — limited access   |
|  Renee — communications — draft-only        |
|                                             |
| SHARED ITEMS                                |
```

```
|  4 task details • 2 service notes             |
|                                               |
| CONNECTIONS                                    |
|  No resource contact information shared        |
|                                               |
| [ Review access ] [ View activity ]            |
└────────────────────────────────────────────────┘
```

Required ledger events

- Invitation created, accepted, expired, removed.
- Permission granted, changed, revoked.
- Sensitive module/item shared or unshared.
- Decision reviewer added or removed.
- Resource connection consented to, sent, withdrawn, or closed.
- Export, archive, deletion, recovery, and sign-out-all-sessions event.

Non-negotiable privacy rules

- A person cannot see that an unshared sensitive item exists.
- An audit log must not leak private activity to unauthorized collaborators.
- The person granting access sees a confirmation of exactly what was shared.
- The person receiving access sees a plain-language “My Access” summary.
- Every resource connection displays recipient, purpose, and exact fields to be shared before consent.

Workflow updates required

All workflows should include a **Review access** action at points where users invite someone, share content, enter a provider, request a resource connection, archive, or export.

Cross-workflow system 03

State, county, and situation localization

Gap

Immediate-death procedures, death certificates, funeral requirements, probate concepts, public benefits, service providers, and support resources vary by state and sometimes county. A generic checklist can be incorrect or unsafe.

Solution

Build a separate, editorially governed **Localization Layer**.

```
User location + event context + workflow stage
                  |
```

Product requirements

- Ask location only when it improves guidance; explain why.
- Let a user override location when the death, property, care recipient, or organizer is in another place.
- Display source, jurisdiction, last reviewed date, and “information may vary” note on procedural content.
- Use a content management workflow with legal/editorial review—not generative text alone—for state-specific instructions.
- Show fallback national guidance and a route to qualified local help when no reviewed local content is available.

Minimum location fields

- Care recipient’s current location.
- Location where death occurred, if applicable.
- Primary property/estate state, if different.
- Organizer’s preferred state for support resources.

Do not make users repeat these inputs; show a “Which location is this about?” selector when a task is location-dependent.

Cross-workflow system 04

Accessibility, language, and low-tech access

Gap

Families may include older adults, people with disabilities, people who use screen readers, people with limited English proficiency, people with limited digital literacy, people sharing a device, and helpers without smartphones.

Solution

Adopt the following as product requirements, not later enhancements.

Accessibility requirements

- Minimum 16px mobile body text; scalable text without broken layouts.
- High contrast that does not rely on color alone.
- Text label beside every icon.
- Screen-reader labels and logical focus order.
- Captions/transcripts for video or audio content.
- Keyboard navigation for web experiences.
- No motion required to understand a workflow; reduced-motion support.
- Large tap targets and forgiving form validation.
- Plain-language reading level with optional “learn more,” rather than dense legal language on every screen.

Language requirements

- Language choice during onboarding and easy language switch later.
- Professionally translated critical safety, consent, and legal-boundary content.
- Do not use machine translation alone for emergency, consent, medical, legal, funeral, or estate content.
- Preserve the meaning and dignity of faith/cultural preferences in translation.

Low-tech participation modes

- Email invitations that work without requiring an app download where possible.
- Print-friendly task and question summaries.
- Shareable, expiring access links only with strong identity/permission controls.
- Telephone-friendly support directory with click-to-call.
- Exportable “family update” and “meeting questions” documents.

Cross-workflow system 05

Resource quality and provider neutrality

Gap

The product promises no paid placement, sponsorship-driven ranking, referral fee, or provider influence. That promise needs a measurable operating model, or the directory and connection features can become a trust risk.

Solution

Create a transparent **Resource Governance Standard.**

Every resource/provider record must show

```
Why this appears
• Service category and area served
• Public, nonprofit, professional, or private business
• Source of listing
• Last verified date
• Language/accessibility information when available
• Cost information or “ask provider” status when available
• Zeporah financial relationship: None
```

Resource rules

- No paid rank, sponsored badge, commission, referral fee, or lead-sale arrangement.
- Separate informational sources, public agencies, nonprofits, providers, and licensed professionals visually.
- Let users flag inaccurate, unavailable, discriminatory, or unsafe listings.
- Establish verification schedule and removal policy.
- Track user complaints and quality signals without publishing unverified accusations.
- Explain clearly that a listing is not an endorsement or guarantee of availability, price, licensing, or quality.

Gentle-connection requirement

No resource receives contact details until the user reviews and confirms:

```
Recipient: [Resource name]
Purpose: [User-selected reason]
Shared: [Exact fields]
Contact method: [In-app / phone / email]
[Confirm] [Cancel]
```

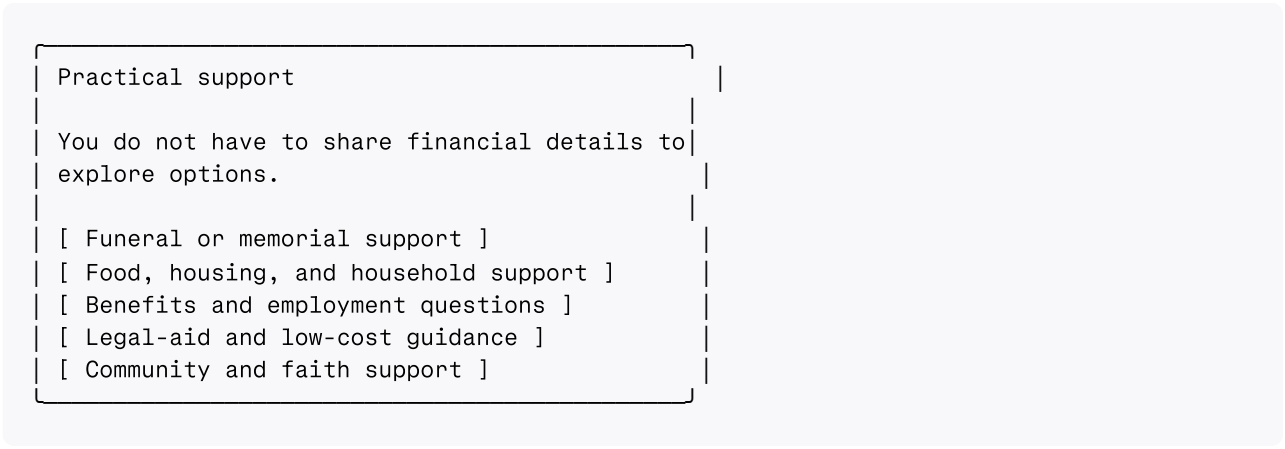

Cross-workflow system 06
Financial hardship and access-to-support pathway

Gap

Families may face immediate financial stress, housing insecurity, food insecurity, inability to afford service arrangements, unpaid caregiving leave, or difficulty paying for legal guidance. The workflows acknowledge this but do not yet provide a unified route.

Solution

Create a dignified, private **Practical Support** pathway.

Guardrails

- No lending, financing, insurance, funeral package, or credit product upsell.
- No required income disclosure before browsing resources.
- Support resources are location-aware only with consent.
- Requests stay private unless the user chooses to share them with a helper.

Cross-workflow system 07

Notification governance

Gap

Notification design can undermine all other privacy and emotional-safety work. A relative's name, funeral plan, diagnosis, financial status, or conflict can be exposed through lock-screen previews or excessive prompts.

Solution

Add a centralized **Notification Center** with safe defaults.

Safe defaults

- Generic previews: "You have a Zeporah update."
- No sensitive text on lock screens.
- No notification sent during user-defined quiet hours.
- No "overdue," "urgent," or streak language for grief and coordination work.
- No automated provider/resource outreach because of inactivity.
- Every optional reminder has a visible stop/pause control.

Notification classes

Class	Default behavior	Example
Safety/emergency	Immediate only after direct user action or confirmed route	“Call emergency services” on active app screen
Time-sensitive family logistics	Opt-in, private, controlled	“Your appointment helper task is today”
Decision review	Selected reviewers only	“A decision you were invited to review is ready”
Gentle check-in	Explicit opt-in only	“Your saved plan is here when you are ready”
Resource connection	Only after user consent	“Your in-app message has been sent”
Marketing	Separate explicit consent, never bundled	Product announcements

Cross-workflow system 08

Support, escalation, and operational boundaries

Gap

A user may contact Zeporah support during a crisis, seek legal/medical advice, report abuse, report a bad provider, request account recovery, or ask to resolve a family dispute. The product needs clear internal and user-facing handling rules.

Solution

Define a **Zeporah Support Triage Model** before public launch.

```
User request
     |
     ├── Product/access issue → Support team workflow
     ├── Emergency/safety issue → Immediate emergency/safety guidance
     ├── Medical question → Care team / hospice / clinician route
     ├── Legal/financial question → Qualified professional/resource route
     ├── Family conflict → Pause/access tools + guidance route
     ├── Provider listing concern → Resource quality review workflow
     └── Privacy/data request → Privacy operations workflow
```

Required policies

- Support staff cannot give medical, legal, financial, or tax advice.
- Support staff cannot determine legal authority, next of kin, beneficiary, executor, or rightful account owner.
- Support staff cannot restore access or transfer ownership solely based on a family claim.
- Safety escalations require a documented playbook, trained staff, and clear limits on what Zeporah can do.
- Provider/resource complaint handling requires evidence, review, and a fair removal process.

- Data access, export, deletion, and recovery requests require privacy and identity-verification controls.

Required workflow transitions

A complete family journey needs explicit handoffs between the six workflows.

```
Care & Preparation
   ├── serious illness/care coordination remains active
   ├── when death is near → optional preparation prompts, never assumption
   └── death occurs → When Death Occurs

When Death Occurs
   ├── immediate instructions captured
   ├── family communication established
   ├── service planning when ready → Honor & Remember
   └── records/responsibilities when ready → Estate & Life Administration

Honor & Remember
   ├── service complete → Continuing Care
   └── costs/documents/contract questions → Estate & Life Administration

Estate & Life Administration
   ├── collaboration/permission needs → Family Coordination
   └── long-tail tasks or pause → Continuing Care

Family Coordination
   └── overlays every workflow; it is never a forced linear stop

Continuing Care
   ├── new administrative question → Estate & Life Administration
   ├── remembrance planning → Honor & Remember memory space
   └── any new care need for another loved one → Care & Preparation
```

Handoff rules

- Never move the user automatically into a new workflow because time has passed.
- Ask permission: “Would you like to begin this when you are ready?”
- Carry only the information necessary for the next workflow, and show what will carry over.
- Do not carry private notes, financial details, or sensitive documents into a shared module automatically.
- Let the user return to the previous workflow at any time.

Updated workflow requirements

Workflow 01 — Care & Preparation

Add:

- Global urgent-help entry.
- Location selector for care resources, with ability to use a different care-recipient location.
- Accessibility/language controls.
- Practical-support card for caregiver relief, food, transport, and household help.
- Notification preferences accessible from the care dashboard.

Workflow 02 — When Death Occurs

Add:

- Global urgent-help and quick-exit support.
- Location confirmation: “Where did this happen?” only after immediate response status is settled.
- Local-content last-reviewed/source display for procedural information.
- Accessibility/low-stimulation view in the immediate route.
- No reliance on push notification during immediate routing.

Workflow 03 — Honor & Remember

Add:

- Resource/provider source and verification disclosures.
- Practical-support route for cost concerns, without financing product prompts.
- Language/cultural preference selector that applies to service planning and resource discovery.
- Accessibility fields for venue, livestream, transport, interpretation, and guests.
- Global safety/privacy controls near announcement and guest features.

Workflow 04 — Estate & Life Administration

Add:

- Location selector for estate/property jurisdiction, separately from organizer location.
- Standard “not advice” and source/last-reviewed display for procedural content.
- Practical-support route for legal aid, benefits, housing, food, and employment resources.
- Print/export-friendly question and inventory summaries.
- Privacy Center link before export, archive, or recovery request.

Workflow 05 — Family Coordination

Add:

- Privacy Center as the primary home for access, sharing, audit, and consent review.
- Notification Center with generic-preview defaults and quiet hours.

- Language/accessibility invitation preferences.
- Support triage route for conflict, safety, access recovery, and privacy requests.
- Explicit transition controls that show what data will carry into each workflow.

Workflow 06 — Continuing Care

Add:

- Global urgent-help access that remains discreet.
- Practical-support route for community resources without forced disclosure.
- Privacy Center review before archive/export.
- Location/language-specific resource filters, only with user consent.
- Clear “return to a prior pathway” choices—administration, service/memory, care, or coordination.

Final launch-readiness checklist

Product safety and trust

- [ ] Emergency and safety layer works on every workflow.
- [ ] Quick exit, session revocation, and generic notification previews are implemented.
- [ ] No automatic outreach, contact sharing, or provider referral is triggered by inactivity.
- [ ] No role, vote, or app activity implies legal authority.
- [ ] Sensitive modules are invisible to unauthorized users, not merely locked.
- [ ] Resource placement is demonstrably free from paid influence.

Content and localization

- [ ] Jurisdiction-specific content has source, date, owner, and review cadence.
- [ ] Users can distinguish organizer, care location, death location, and estate/property location.
- [ ] There is a fallback route when localized content is unavailable.
- [ ] Translation and accessibility review covers all safety, consent, and boundary content.

Operations and data

- [ ] Support triage policies and escalation training exist.
- [ ] Access recovery, backup coordinator, death/incapacity, and ownership-dispute policies are defined.
- [ ] Data retention, deletion, export, and audit-log policies are implemented and communicated.
- [ ] Security requirements for sensitive uploads are defined before upload capability launches.
- [ ] Provider/resource verification and complaint handling have owners and service-level expectations.

Family experience

- [ ] Every workflow has one clear next step and an equally visible pause path.
- [ ] Every collaboration invitation shows exact access before it is sent.
- [ ] Families can choose no service, no reminder, no outreach, no shared memory, and no public information without penalty.
- [ ] The app never uses shame, urgency, streaks, completion scores, or “overdue” language for grief.
- [ ] Families can preserve memories while separately archiving administration.

Product recommendation

Before adding more feature depth, build a cross-functional **Zeporah Trust Layer** containing:

1. Privacy Center and granular permission engine.
2. Consent and audit ledger.
3. Notification Center with safe defaults.
4. Emergency/safety and quick-exit behavior.
5. Localization content system and editorial-review process.
6. Resource-governance and no-paid-placement operations.
7. Accessibility/language standard.
8. Account recovery, backup, and support-triage policies.

This Trust Layer is what turns the workflow set from thoughtful product concepts into a responsible foundation for a family-care platform.
